Making Your Windows Safe for Birds

You hear a loud thud at your living room window. Looking up, you see a few tiny feathers stuck to the glass. Others drift slowly to the ground. One more bird has been struck down in a collision with a plate-glass window.

doesn’t solve your problem, you’ll need to alter the appearance of the offending windows. But to do this, you’ll need to figure out why the collisions are occurring. Ask some questions. Are birds confused because the window is reflecting the landscape behind it? Is the glass so transparent they think it isn’t there? To find out, you’ll need to get a bird’s-eye view.

Take a Bird’s-Eye View

See-Through Glass

Go to your feeder and look at your window. Can you see through it? If so, the birds can, too. Is there a plant or something else inside the house that might be attractive to birds? If so, try moving it. Is there another window on the opposite side of the house, creating the illusion of a fly-through passage? Try making your windows less transparent by changing the lighting inside the house—pull a shade or open or close a door.

You can also make glass less transparent by taping paper or cardboard to the inside of the panes. This is unsightly, but it’s a good temporary measure until you can find a better solution. Commercially available hawk silhouettes are effective at deterring window strikes, as long as you use several. They work not because they look like hawks, but because they break up the window’s appearance. Another possible solution is to put up a commercially available

Some Solutions

- Move feeders to new locations. Usually bird strikes occur at just one or two windows. Moving feeders away from them may solve the problem entirely.
- Place feeders closer to the glass. If a feeder is just a foot or two from a window, panicked birds may still fly into it, but they probably won’t have enough momentum to injure themselves.
- Alter the windows’ appearance. If you don’t want to move your feeders, or if relocating them doesn’t solve your problem, you’ll need to alter the appearance of the offending windows. But to do this, you’ll need to figure out why the collisions are occurring. Ask some questions. Are birds confused because the window is reflecting the landscape behind it? decal that is a replica stabilimen- tum or white zig-zag from the center of an orbital spider's web. It is thought that spiders create the highly visible zig-zag so birds and large insects will avoid flying into and destroying their webs. Note: Do not attach objects directly to thermopane windows without consulting the manufacturer.

Reflective Windows
Windows that mirror the outside habitat present a different problem. If you see branches or sky reflected in the glass when you look at your windows, you’ll understand why the birds are confused. In this situation, changing the lighting inside the house or fastening objects to the inside of the glass won’t help.

Instead, you’ll need to alter the window’s appearance by placing something on the outside. As a temporary measure, you can rub a bar of soap on the window (the streaks can be easily removed).

Other solutions suggested by participants in Project FeederWatch include attaching strips of paper or cardboard to the window, hanging ribbons, streamers, colored string, festive garlands, or even mobiles in front of it.

One California FeederWatcher was determined to put an end to bird collisions at her home. She criss-crossed her big picture windows with dead tree limbs. She claims success.

Treating Dazed Birds
Birds don’t always die when they strike windows. Sometimes they fly away, apparently unharmed; other times they fall to the ground, stunned. If you find a dazed bird, take it inside where predators can’t reach it and place it in a dark container such as a shoe box. The darkness will keep the bird quiet while it revives, which should occur within a few minutes, unless it is seriously injured. Release the bird as soon as it appears awake and alert.

Some Related Topics
Home windows aren’t the only flying hazard birds face, of course. A couple of other dangers include blind collisions with tall buildings and towers. Migrating birds can even be attracted to building and tower lights. For more information on these topics, go to the following web sites: <http://towerkill.com> and <http://www.flap.org/>.

Summary and Reminder
You might not always see or hear birds striking your windows. Check the ground below your windows periodically. If you find dead birds, move your feeders or modify the windows. Birds face plenty of natural dangers. Let’s not subject them to unnatural ones.

Enhance Your Enjoyment of Birds
and Help Promote a Better Understanding of Them

Join the Cornell Lab of Ornithology. Your annual membership helps support research, education, and citizen-science projects, including studies about the movements of birds and the changes in their numbers over time. You’ll receive subscriptions to our award-winning magazine, Living Bird, our newsletter, BirdScope, and more.
