How to Install the Drip Tray in a SwiftOne

The drip tray is crucial for catching any battery acid leaks, preventing them from damaging the main board of the device.

Tools and Materials Needed:

- **Small Phillips Head Screwdriver**
- **Drip Tray**

---

1. **Locate the Installation Points:**
   - Identify the two existing screws where the drip tray will be installed.

2. **Remove Existing Screws:**
   - Use the Phillips head screwdriver to remove the screws and associated toothed washers from the device.

3. **Align the Drip Tray:**
   - Place the drip tray so that its holes align with the screw holes on the device.
   - You may find that placing the washers and screws in the tray's holes first is helpful to keep them in place during installation

4. **Secure the Drip Tray:**
   - Use the Phillips head screwdriver to tighten the screws and washers down, securing the drip tray in place. *Note: If you have an older Swift, the tray may tilt up slightly because of the placement of a few brackets.*
